

CARPOOL DENSITIES IN THE TERRITORY OF PUERTO RICO

NATURAL BREAKS

STANDARD DEVIATION

QUANTILE

GEOMETRIC INTERVAL

Thousands of citizens of Puerto Rico travel to work daily. They get to work via many modes of transportation, including carpooling. Mapped above are the counties in Puerto Rico with the lowest and highest rates of carpooling. The lowest densities are a lighter green, while the higher densities are represented in a darker green. Densities are calculated through four different statistical analysis methods: natural breaks, standard deviation, quantile, and geometric interval.
